Command	What It Does
cat	Print the entire contents of a file to the terminal
cd	Change directory (cd /path = absolute, cd path = relative)
echo	Print text or the value of variables to the terminal
find	Search for files and directories by name, type, or location
grep	Search text inside files for a matching pattern
host	Perform DNS lookups to find IP addresses or hostnames
ip a	Show network interfaces and their IP addresses
ip route	Display the system's routing table
ls	List files and directories in the current directory
nano	Terminal text editor for creating and editing files
nslookup	Query DNS to find the IP address for a domain name
ping	Test network connectivity by sending ICMP echo requests
(pipe)	Send the output of one command as the input to another command
pwd	Print the current working directory
ssh user@host	Connect securely to a remote computer using SSH
sudo	Run a command with administrator (root) privileges
systemctl	Manage system services (start, stop, restart, enable, disable, check status)
touch	Create an empty file or update a file's timestamp
traceroute	Show the network path (hops) packets take to a destination
